

Asset management

To be successful in our sector, an operator must take the following factors into account in developing an asset strategy: operating rolling stock is a capital-intensive business which requires a long-term focus. New laws are introduced whilst current ones are frequently changing, which also change requirements for the operation of rolling stock. A clear example of this is barrier-free access. Today's passengers also expect more comfort, including air conditioning and mobile connectivity. Operations within this sector are also subject to constant change. Additionally, the pressure on costs, especially for maintenance, is ever-increasing.

- Plans for the existing fleet
- Operating plans
- Investment plans
- Risk analyses
- Maintenance strategies

Contact us

PROSE provides an operator's asset manager with all relevant long-term information for daily decisions and supports the development of asset strategy with:

- A plan for the existing rolling stock, including its use and remaining life expectancy
- An operating plan, including existing and new services, operational scenarios, and on-board services
- An investment plan showing future needs for additional rolling stock, procurement projects, intended investments in existing rolling stock, modernisation projects and future decommissioning of obsolete rolling stock
- Risk analysis
- A maintenance strategy showing make-or-buy decisions, required investments in maintenance facilities and planned maintenance contracts
